1 Introduction

You may use Word, LaTeX, or any other text editor you want, but please follow this structure and guidelines.

In this section you begin by describing the context of your project.

Then you provide the goal of the project.

Which methodology or steps you followed to reach that goal.

All the above may be taken from the original proposal submitted.

Briefly list the results of the project, what did you accomplish which will be reported in this paper.

You may organize your final report however you want, create as many sections as you need, but their content must be substantial, otherwise do not make a section out of it.

Your report must have references all of which must be cited in the text. This report shows several examples of how to put the references (always at the end) and how to cite them. Other standard ways of presenting them are valid, here we use a plain style in which they are numbered. Ah, those references need to be complete, even if they are from a webpage, in addition to providing the url, say the author, and when you last accessed it.

The final paragraph of the introduction must summarize the content of the paper, section by section, what follows is an example of one way of writing that final paragraph. The paragraph copied here was taken from the introduction of this paper: [1].

This paper is organized into seven sections. Section 2 is about the characteristics of NoSQL databases. Section 3 is about categories of NoSQL databases. While Section 4 is BASE analysis of NoSQL. Section 5 is a Discussion about the BASE features of various NoSQL. Section 6 is about the benchmarking of Cloud services with a focus on NoSQL. Section 7 is Observations and recommendations for picking up NoSQL for a particular application. Section 8 concludes the paper.

2 General guidelines

This section provides several basic rules and general advice about the layout of your report. The way in which it is written is also illustrative. For example, there are two sets of bullets here, you should never write in bullets, that is ok for a presentation but not for a report of this kind. That does not mean you cannot use bullets, but then provide an introduction for the bullets and say what they represent. Also, if you have too many bullets, they should be numbered for easier reference later and for the user. Five or less bullets may not be numbered. In narrative you write the numbers under 10 in letters, 10 and higher may go in numbers. But the section numbers in the final paragraph of the introduction go in numbers too (see section 1).

There are some basic rules that apply to this as a technical report. Some of them follow in a numbered list, but the number does not have a meaning, just to ease its reading and facilitate referencing them later.

1. terms are defined before usage,
2. use full sentences and proper grammar,
3. never place titles together without text in between,
4. every section needs an introduction and if you have subsections each one of them also needs introductory text,
5. key idea/element should come first in the sentence,
6. do not spend time on the obvious,
7. direct, simple, precise, and concise language is preferred,
8. eliminate details that do not communicate information.

About the layout, these are useful to keep in mind:

- few variations in font type and size are preferred,
- uniformity in style speed up reading and builds expectations,
- reading bandwidth is a major concern in putting together the layout,
- too much indentation and white space can reduce the volume of information one can perceive at a glance,
- if you are to include figures, they should be numbered and have a caption with that number and what they are at the bottom of the figure. Tables on the other hand must have their title at the top of the table.

3 Content 2

This section was too close to the bottom of the page, so we started a new page with it. Never leave a title or section hanging at the bottom of a page, with the associated text in the following page, put them together in a new page. Amazing that I have to say this explicitly, but I have seen it happen so many times. I am saving myself some writing of comments.

You may not start a section with a figure, if you want to include a figure, you must announce it first by referring to its number. Just like we do here. Figure 1 shows the ER schema of a simple Company Database (the one we used at the beginning of the semester).

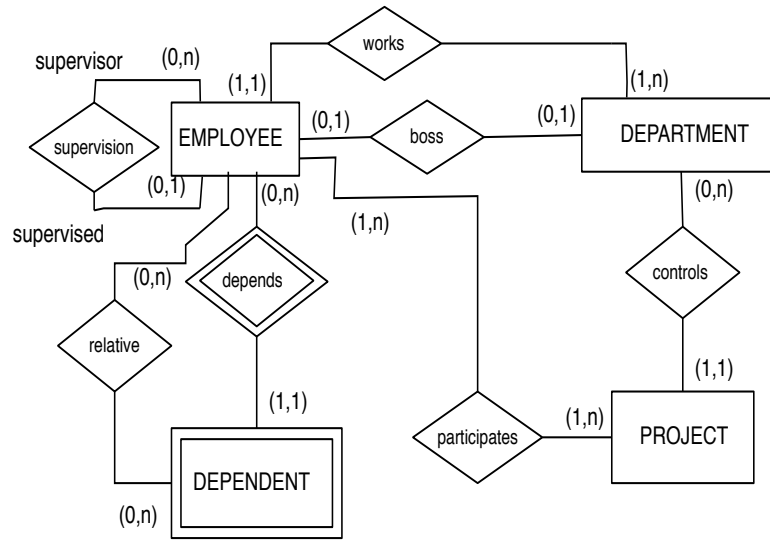

Figure 1: A Company Database

There are several formats for including your references, pick one of the standard ones, we show different ones here. To cite the original paper by Tim Berners-Lee we do this [2].

3.1 A subsection under content 2

Create a subsection only if you have substantial content for it. Do not overstructure your report. But everything that is an actual section or subsection, must be numbered, as the ones in this report are numbered.

4 Conclusions

This is the final section of your report, immediately before the references. It must have the following prescribed structure.

First, summarize what was done in this project, in general terms what was accomplished.

Second, describe each of the products of the project, you may use a complete paragraph for each. And yes, this might be repetitive of things you said in the previous sections, but should be said in different words. Summarizing...

Finally, provide your own conclusions after completing this project. What you learned, what you tested, words for someone working on this area, connections between different topics of the class. This final paragraph(s) must be substantial too.

I might start using this book [3] in future editions of this class.
