

DataLab Part 2 Credits

1. <https://www.hackerearth.com/practice/basic-programming/bit-manipulation/basics-of-bit-manipulation/tutorial/>
 - Used for designing 'greatesBitPos', Not in notes, See 'largest_power' in article
 - 5 helped with design of gretestPosBits as well, see 'Determine if a word has a byte greater than n' in article
2. <https://stackoverflow.com/questions/9105713/of-bits-needed-to-represent-a-number-x>
 - Used for 'howManyBits' they had wrong implementations for this problem but helped me start the problem
3. <https://www.open-std.org/jtc1/sc22/wg21/docs/papers/2017/p0543r0.html>
4. https://en.wikipedia.org/wiki/Saturation_arithmetic?utm_source
 - 3 for 'satAdd' again implement wring but was good starting point to begin from, 4 has general info on operations
5. <https://graphics.stanford.edu/~seander/bithacks.html>
 - Used for all probs, a lot of info
6. https://en.wikipedia.org/wiki/Single-precision_floating-point_format?utm_source
 - Info for I-to-F method, supplementary to slide.

Source 5 was used for all problems.
