

CS442 Project Progress Repot

Tomas Salaz

So far, I have the repo cloned and have started to implement the Matric Matrix Multiply. I set the tutorial up to have 4 parts.

The first 2 parts are easy, Part 1 is just taking the Blocked/Partitioned from HW1 and modifying it to use Processes to Send/Recv data. Part 2 is Taking the Fox's and Cannon's algorithms from HW2 and reusing them to get initial times.

Part 3 is more Complicated and is where the One-Sided communication comes in. Since It is more complex, I want to implement RMA on the Blocked/Partitioned Method and then to choose either Fox's or Cannon's to implement RMA.

So the only new things we are coding are 'rma_blocked_matmat()' and either 'rma_fox()' or 'rma_cannon()'

Then the last part is to Write a main to test the 2 RMA methods against the normal methods. Im not too sure how I am going to test for correctness. Right now I plan on just testing that the RMA are faster than their normal implementations.

TODO:

Write up the Tutorial Report

Implement the RMA Methods

Modify Tutorial Shell to compile and run the main.cpp file to Test times.

I will either send a Discord Message or Email if I hit any hiccups.
